

1. Define  $f(x) = x^3 - 3x^2 + 3x$ .

<p>(a) Estimate the area between the graph of <math>f</math> and the <math>x</math>-axis on the interval <math>[1, 3]</math> using a left-hand sum with four rectangles of equal width.</p> <p><math>\Delta x = \frac{3-1}{4} = 0.5</math></p> <table border="1" data-bbox="527 466 820 716"> <thead> <tr> <th><math>x</math></th> <th><math>f(x)</math></th> </tr> </thead> <tbody> <tr> <td>1</td> <td>1</td> </tr> <tr> <td>1.5</td> <td>1.125</td> </tr> <tr> <td>2</td> <td>2</td> </tr> <tr> <td>2.5</td> <td>4.375</td> </tr> <tr> <td>3</td> <td>9</td> </tr> </tbody> </table> <p><math>LHS = (1 + 1.125 + 2 + 4.375)(0.5) = 4.25</math></p>	$x$	$f(x)$	1	1	1.5	1.125	2	2	2.5	4.375	3	9	<p>+1 <math>\Delta x = 0.5</math></p> <p>+1 <math>f(1) + f(1.5) + f(2) + f(2.5)</math></p> <p>+1 4.25</p>
$x$	$f(x)$												
1	1												
1.5	1.125												
2	2												
2.5	4.375												
3	9												
<p>(b) Is the estimate in part (a) an over-estimate or underestimate of the actual area? Justify your conclusion.</p> <p>Observe that</p> $f'(x) = 3x^2 - 6x + 3$ $= 3(x^2 - 2x + 1)$ $= 3(x-1)^2$ <p>Since <math>f' &gt; 0</math>, for <math>x &gt; 1</math>, the function <math>f</math> is increasing on <math>(1, 3]</math>. Furthermore, since <math>f(1) = 1</math>, <math>f</math> is positive and increasing on <math>[1, 3]</math>. As a result, each rectangle in the left-hand sum will lie below the graph of <math>f</math>. Thus the area estimate is an underestimate.</p>	<p>+1 Underestimate</p> <p>+1 Correct supporting work</p>												
<p>(c) Use a definite integral to calculate the exact area between the graph of <math>f</math> and the <math>x</math>-axis on the interval <math>[1, 3]</math>.</p> $\int_1^3 x^3 - 3x^2 + 3x \, dx = \left( \frac{1}{4}x^4 - x^3 + \frac{3}{2}x^2 \right) \Big _1^3$ $= \frac{1}{4}(3)^4 - (3)^3 + \frac{3}{2}(3)^2 - \left( \frac{1}{4}(1)^4 - (1)^3 + \frac{3}{2}(1)^2 \right)$ $= 6$	<p>+1 Correctly integrate <math>f</math></p> <p>+1 Correct limits of integration</p> <p>+1 Apply the Fundamental Theorem of Calculus</p> <p>+1 Area = 6</p>												

4. The graph of a function  $f$  is shown in the figure below. It consists of two lines and a semicircle. The regions between the graph of  $f$  and the  $x$ -axis are shaded.

$$\text{Editor: } f(x) = \begin{cases} x+3 & -3 \leq x \leq -2 \\ \sqrt{4-x^2} + 1 & -2 < x < 2 \\ -x+3 & 2 \leq x \leq 4 \end{cases}$$

<p>(a) Write the definite integral or sum of definite integrals that measures the area of the shaded region.</p> $\int_{-3}^3 f(x) dx + \left  \int_3^4 f(x) dx \right $	<p>+1 limits of integration +1 integrand +1 appropriately deal with the canceling of areas</p>
<p>(b) Calculate <math>\int_0^3 f(x) dx</math> and <math>\int_3^4 f(x) dx</math>.</p> <p>The area of a circle of radius 2 is <math>A = 4\pi</math>. Therefore, the area of a quarter circle of radius 2 is <math>\pi</math>. The shaded region between <math>x = 0</math> and <math>x = 2</math> is a quarter circle combined with a rectangle of area 2. Therefore, <math>\int_0^2 f(x) dx = 2 + \pi</math>. The area of the triangular region between <math>x = 2</math> and <math>x = 3</math> is 0.5. Thus <math>\int_2^3 f(x) dx = 0.5</math>.</p> $\int_0^3 f(x) dx = 2 + \pi + 0.5 \approx 5.641$ <p>The area of the triangular region between <math>x = 3</math> and <math>x = 4</math> is 0.5. However, since this region is below the <math>x</math>-axis,</p> $\int_3^4 f(x) dx = -0.5.$	<p>+1 Area of semi circle is <math>\pi</math> +1 <math>\int_0^3 f(x) dx = 2 + \pi + 0.5 \approx 5.641</math> +1 <math>\int_3^4 f(x) dx = -0.5</math></p>
<p>(c) Determine the area of the shaded region.</p> $\begin{aligned} \text{Area} &= \int_{-3}^3 f(x) dx + \left  \int_3^4 f(x) dx \right  \\ &= 2 \int_0^3 f(x) dx + \left  \int_3^4 f(x) dx \right  \\ &= 5 + 2\pi + 0.5 \approx 11.783 \end{aligned}$	<p>+1 <math>\int_{-3}^3 f(x) dx = 5 + 2\pi</math> +1 Appropriately deal with signed area +1 Area = 11.783</p>

7. Define  $f(x) = \frac{1}{x}$ .

<p>(a) Use the trapezoidal rule with <math>n = 5</math> to estimate <math>\int_1^2 f(x) dx</math>.</p> $\frac{b-a}{2n} = \frac{2-1}{2(5)} = 0.1$ $\int_1^2 f(x) dx \approx 0.1 \left( \frac{1}{1} + 2 \left( \frac{1}{1.2} \right) + 2 \left( \frac{1}{1.4} \right) + 2 \left( \frac{1}{1.6} \right) + 2 \left( \frac{1}{1.8} \right) + \frac{1}{2} \right)$ $\approx 0.696$	<p>+1 <math>\frac{b-a}{2n} = 0.1</math></p> <p>+2 Proper use of trapezoidal rule</p> <p>+1 0.696</p>
<p>(b) <math>\int f(x) = \ln x  + C</math>. Use the Fundamental Theorem of Calculus to calculate the <u>exact</u> value of <math>\int_1^2 f(x) dx</math></p> $\int_1^2 f(x) dx = \ln 2  - \ln 1 $ $= \ln 2$	<p>+1 Use Fundamental Theorem of Calculus</p> <p>+1 <math>\ln 2</math> or 0.693</p> <p>+1 Exact value</p>
<p>(c) Explain why the trapezoidal rule cannot be used to estimate <math>\int_{-1}^1 f(x) dx</math>.</p> <p>The function <math>f(x) = \frac{1}{x}</math> is discontinuous at <math>x = 0</math>. Since the function <math>f</math> is not continuous on <math>[-1, 1]</math>, the trapezoidal rule may not be used.</p>	<p>+1 <math>f</math> discontinuous at <math>x = 0</math></p> <p>+1 continuity required for trapezoidal rule</p>
